Differential calculus, a cornerstone of mathematics, forms the basis for understanding rates of change. This crucial branch of calculus finds extensive applications in various fields, from physics and engineering to economics and finance. Understanding differential calculus unlocks the ability to model dynamic systems and solve complex optimization problems. This delves into several differential calculus problems with detailed solutions, aiming to provide a practical and conceptual understanding of the subject. Understanding the Fundamentals: Before diving into problems, let's briefly revisit some fundamental concepts:

- **Derivatives**: The derivative of a function represents the instantaneous rate of change of that function at a particular point. Geometrically, it represents the slope of the tangent line to the curve at that point.
- **Differentiation Rules**: Several rules, such as the power rule, product rule, quotient rule, and chain rule, simplify the process of finding derivatives.
- **Applications of Derivatives**: Derivatives are used to find maxima and minima, determine concavity, analyze velocity and acceleration, and model various real-world phenomena.

Differential Calculus Problems with Solution: Let's tackle a few problems, progressing in difficulty:

Problem 1: Finding the Derivative of a Polynomial Find the derivative of $f(x) = 3x^3 - 2x^2 + 5x - 7$. **Solution**: Applying the power rule ($\frac{d}{dx}(x^n) = nx^{n-1}$), we get: $f'(x) = 9x^2 - 4x + 5$

Problem 2: Applying the Product Rule Find the derivative of $g(x) = (x^2 + 1)(2x - 3)$. **Solution**: Using the product rule [$\frac{d}{dx}(uv) = u(\frac{dv}{dx}) + v(\frac{du}{dx})$], we have: $g'(x) = (x^2 + 1)(2) + (2x - 3)(2x) = 2x^2 + 2 + 4x^2 - 6x = 6x^2 - 6x + 2$

Problem 3: Utilizing the Chain Rule Find the derivative of $h(x) = (x^2 + 1)^3$. **Solution**: Employing the chain rule [$\frac{d}{dx}[f(g(x))] = f'(g(x)) * g'(x)$], we get: $h'(x) = 3(x^2 + 1)^2 * (2x) = 6x(x^2 + 1)^2$

Problem 4: Optimization Problem A farmer wants to enclose a rectangular area of 1000 square meters using the least amount of fencing. What dimensions should the rectangle have? **Solution**: Let x and y be the dimensions of the rectangle. The area is $xy = 1000$, and the perimeter (amount of fencing) is $P = 2x + 2y$. We can express y as $y = 1000/x$. Substituting into the perimeter equation, we get $P(x) = 2x + 2000/x$. To minimize the perimeter, we find the derivative and set it to zero: $P'(x) = 2 - 2000/x^2 = 0$ Solving for x , we get $x = 10\sqrt{10}$ meters. Then, $y = 1000/(10\sqrt{10}) = 10\sqrt{10}$ meters. Therefore, the rectangle should be a square with sides of approximately 31.62 meters.

Problem 5: Related Rates Problem A spherical balloon is inflated at a rate of 10 cubic centimeters per second. How fast is the radius increasing when the radius is 5 centimeters? **Solution**: The volume of a sphere is $V = (4/3)\pi r^3$. Differentiating with respect to time (t), we get $dV/dt = 4\pi r^2(dr/dt)$. We are given $dV/dt = 10 \text{ cm}^3/\text{s}$ and $r = 5 \text{ cm}$. Substituting, we get: $10 = 4\pi(5)^2(dr/dt)$ Solving for dr/dt , we find the radius is increasing at approximately 0.0318 cm/s.

Unlocking the Power of Change: Differential Calculus Problems with Solutions

Ever felt that thrill when you can precisely describe how something is changing? Whether it's the speed of a car, the growth rate of a population, or the slope of a winding mountain road, the concept of change is fundamental to understanding our world. And at the heart of quantifying and analyzing this change lies differential calculus. For many, the mention of "calculus problems" can conjure images of intimidating equations and abstract concepts. But fear not! Differential calculus, in essence, is all about rates of change. It provides us with the tools to not only understand instantaneous rates but also to predict future behavior based on these rates. In this comprehensive guide, we'll dive deep into differential calculus problems, breaking them down with clear explanations and providing step-by-step solutions. We'll explore various types of problems, from basic derivatives to more complex applications, making this topic accessible and, dare we say, even enjoyable!

What Exactly IS Differential Calculus?

Before we tackle those problems, let's get a solid grasp on what differential calculus is all about. At its core, it's the study of derivatives. A derivative, in simple terms, represents the instantaneous rate of change of a function. Think of it like taking a snapshot of how quickly something is changing at a very specific moment. We use the concept of a limit to define the derivative. Imagine zooming in on a curve. As you zoom closer and closer, the curve starts to look like a straight line. The slope of this infinitesimally small "straight line" segment is the derivative at that point. This powerful idea allows us to analyze curves and functions with incredible

precision.

The applications of differential calculus are vast and touch almost every field imaginable: **Physics:** Calculating velocity and acceleration from position, understanding forces, and modeling motion. **Engineering:** Optimizing designs, analyzing stress and strain, and controlling systems. **Economics:** Determining marginal cost, marginal revenue, and profit maximization. **Biology:** Modeling population growth, spread of diseases, and chemical reaction rates. **Computer Science:** Developing machine learning algorithms and optimizing performance. **Medicine:** Studying drug delivery and analyzing physiological responses. The ability to model and predict change is a cornerstone of scientific and technological advancement. And that's where solving differential calculus problems comes in!

Core Concepts and Basic Derivative Problems

Let's start with the foundational building blocks. Understanding these basic derivative rules will equip you to tackle more intricate problems.

The Power Rule: Your First Best Friend

This is perhaps the most fundamental rule you'll encounter. For any function of the form $f(x) = ax^n$, where 'a' is a constant and 'n' is any real number, the derivative is given by: $f'(x) = n \cdot ax^{n-1}$. Essentially, you bring the exponent down as a multiplier and then subtract 1 from the original exponent.

Problem 1: Differentiate $f(x) = 5x^3$

Solution: Here, $a = 5$ and $n = 3$. Applying the power rule: $f'(x) = 3 \cdot 5x^{3-1}$ $f'(x) = 15x^2$
Explanation: The rate of change of the function $5x^3$ at any point x is $15x^2$.

Problem 2: Differentiate $g(x) = 7x$

Solution: We can think of this as $g(x) = 7x^1$. So, $a = 7$ and $n = 1$. Applying the power rule: $g'(x) = 1 \cdot 7x^{1-1}$ $g'(x) = 7x^0$ Since any non-zero number raised to the power of 0 is 1, we have: $g'(x) = 7$
Explanation: The function $7x$ is a straight line with a slope of 7. Its rate of change is constant, which is 7.

Problem 3: Differentiate $h(x) = 12$

Solution: This is a constant function. We can write it as $h(x) = 12x^0$. So, $a = 12$ and $n = 0$. Applying the power rule: $h'(x) = 0 \cdot 12x^{0-1}$ $h'(x) = 0$
Explanation: The derivative of a constant is always zero because a constant function doesn't change. Its slope is flat.

The Sum and Difference Rule: Handling Multiple Terms

When you have a function that's a sum or difference of several terms, you can simply differentiate each term individually and then add or subtract the results. If $f(x) = u(x) \pm v(x)$, then $f'(x) = u'(x) \pm v'(x)$.

Problem 4: Differentiate $f(x) = 3x^4 - 2x^2 + 6x - 9$

Solution: We'll differentiate each term:
* Derivative of $3x^4$: $4 \cdot 3x^{4-1} = 12x^3$ (using the power rule)
* Derivative of $-2x^2$: $2 \cdot (-2)x^{2-1} = -4x^1 = -4x$ (using the power rule)
* Derivative of $6x$: $1 \cdot 6x^{1-1} = 6x^0 = 6$ (using the power rule)
* Derivative of -9 : 0 (derivative of a constant)
Combining these: $f'(x) = 12x^3 - 4x + 6 - 0$ $f'(x) = 12x^3 - 4x + 6$
Explanation: We applied the power rule and sum/difference rule to break down the polynomial and find its derivative.

The Product Rule: Multiplying Functions

When you need to differentiate a function that is the product of two other functions, say $f(x) = u(x) \cdot v(x)$, you use the product rule: $f'(x) = u'(x)v(x) + u(x)v'(x)$. This rule might seem a bit complex at first, but it's essential for many differentiation problems. It states that the derivative of a product is the derivative of the first function times the second, plus the first function times the derivative of the second.

Problem 5: Differentiate $f(x) = (x^2 + 1)(3x - 5)$

Solution: Let $u(x) = x^2 + 1$ and $v(x) = 3x - 5$. First, find the derivatives of $u(x)$ and $v(x)$: $u'(x) = 2x$ (using the power rule and sum rule) $v'(x) = 3$ (using the power rule and sum rule). Now, apply the product rule: $f'(x) = u'(x)v(x) + u(x)v'(x)$ $f'(x) = (2x)(3x - 5) + (x^2 + 1)(3)$ Expand and simplify: $f'(x) = (6x^2 - 10x) + (3x^2 + 3)$ $f'(x) = 6x^2 - 10x + 3x^2 + 3$ $f'(x) = 9x^2 - 10x + 3$ **Explanation:** We successfully differentiated a product of two polynomials by carefully applying the product rule and then simplifying the resulting expression.

The Quotient Rule: Dividing Functions

Similarly, when differentiating a function that's a quotient of two functions, $f(x) = \frac{u(x)}{v(x)}$, we use the quotient rule: $f'(x) = \frac{u'(x)v(x) - u(x)v'(x)}{[v(x)]^2}$. Think of this as: (derivative of the top times the bottom) minus (the top times the derivative of the bottom), all divided by the bottom squared.

Problem 6: Differentiate $f(x) = \frac{x^3}{x^2 + 4}$

Solution: Let $u(x) = x^3$ and $v(x) = x^2 + 4$. Find their derivatives: $u'(x) = 3x^2$ $v'(x) = 2x$. Apply the quotient rule: $f'(x) = \frac{u'(x)v(x) - u(x)v'(x)}{[v(x)]^2}$ $f'(x) = \frac{(3x^2)(x^2 + 4) - (x^3)(2x)}{(x^2 + 4)^2}$ Expand and simplify the numerator: $f'(x) = \frac{(3x^4 + 12x^2) - (2x^4)}{(x^2 + 4)^2}$ $f'(x) = \frac{3x^4 + 12x^2 - 2x^4}{(x^2 + 4)^2}$ $f'(x) = \frac{x^4 + 12x^2}{(x^2 + 4)^2}$ **Explanation:** The quotient rule, while a bit more involved, allows us to find the derivative of rational functions. We performed the steps systematically to arrive at the correct answer.

Beyond the Basics: Chain Rule and Trigonometric Derivatives

Once you've mastered the fundamental rules, you'll encounter more complex functions. The chain rule and derivatives of trigonometric functions are crucial for these.

The Chain Rule: Differentiating Composite Functions

A composite function is like a function within a function, e.g., $f(x) = \sin(x^2)$. To differentiate these, we use the chain rule: If $y = f(g(x))$, then $\frac{dy}{dx} = f'(g(x)) \cdot g'(x)$. In simpler terms, you differentiate the "outer" function (treating the inner function as a variable) and then multiply by the derivative of the "inner" function.

Problem 7: Differentiate $f(x) = (2x^3 - 5)^4$

Solution: This is a composite function. Let the outer function be u^4 and the inner function be $u = 2x^3 - 5$. * Derivative of the outer function: $\frac{d}{du}(u^4) = 4u^3$. * Derivative of the inner function: $\frac{du}{dx} = \frac{d}{dx}(2x^3 - 5) = 6x^2$. Apply the chain rule: $f'(x) = \frac{d}{du}(u^4) \cdot \frac{du}{dx}$ $f'(x) = 4u^3 \cdot (6x^2)$ Now substitute back $u = 2x^3 - 5$: $f'(x) = 4(2x^3 - 5)^3 \cdot (6x^2)$ $f'(x) = 24x^2(2x^3 - 5)^3$ **Explanation:** The chain rule is indispensable for functions that involve nested operations. We broke it down into outer and inner components.

Derivatives of Trigonometric Functions

These are standard formulas you'll need to memorize: $\frac{d}{dx}(\sin x) = \cos x$, $\frac{d}{dx}(\cos x) = -\sin x$, $\frac{d}{dx}(\tan x) = \sec^2 x$, $\frac{d}{dx}(\cot x) = -\csc^2 x$, $\frac{d}{dx}(\sec x) = \sec x \tan x$, $\frac{d}{dx}(\csc x) = -\csc x \cot x$

Problem 8: Differentiate $f(x) = \sin(3x^2)$

Solution: This requires the chain rule along with the derivative of sine. Let the outer function be $\sin(u)$ and the inner function be $u = 3x^2$.
* Derivative of the outer function: $\frac{d}{du}(\sin u) = \cos u$.
* Derivative of the inner function: $\frac{du}{dx} = \frac{d}{dx}(3x^2) = 6x$.
Apply the chain rule: $f'(x) = \cos u \cdot (6x)$
Substitute back $u = 3x^2$: $f'(x) = \cos(3x^2) \cdot (6x)$
 $f'(x) = 6x \cos(3x^2)$
Explanation: We combined the chain rule with the known derivative of the sine function to solve this problem.

Applications of Differential Calculus Problems

The real magic of differential calculus happens when we apply it to solve real-world problems.

Finding Slopes of Tangent Lines

The derivative of a function at a specific point gives you the slope of the tangent line to the curve at that point. This is a fundamental geometric interpretation.

Problem 9: Find the slope of the tangent line to the curve $y = x^3 - 2x + 1$ at the point where $x = 2$.

Solution: First, find the derivative of the function: $\frac{dy}{dx} = \frac{d}{dx}(x^3 - 2x + 1)$
 $\frac{dy}{dx} = 3x^2 - 2$
Now, substitute $x = 2$ into the derivative to find the slope: Slope = $3(2)^2 - 2$
Slope = $3(4) - 2$
Slope = $12 - 2$
Slope = 10
Explanation: The derivative gives us the instantaneous rate of change, which, for a curve, is the slope of its tangent line at a given point.

Optimization Problems: Finding Maxima and Minima

Optimization problems are a cornerstone of applied calculus. We use derivatives to find the maximum or minimum values of a function, which often correspond to the optimal solutions in various scenarios. The process usually involves: 1. Setting up a function that represents the quantity to be optimized. 2. Finding the derivative of this function. 3. Setting the derivative equal to zero and solving for the critical points. 4. Using the first or second derivative test to determine if these points are maxima or minima.

Problem 10: A farmer wants to fence a rectangular field adjacent to a river. The side along the river does not need fencing. If the farmer has 100 meters of fencing, what dimensions will maximize the area of the field?

Solution: Let the width of the field (perpendicular to the river) be w and the length (parallel to the river) be l . The total fencing used is $2w + l = 100$. The area of the field is $A = l \cdot w$. We need to express the area as a function of a single variable. From the fencing equation, we can write $l = 100 - 2w$. Substitute this into the area formula: $A(w) = (100 - 2w)w$
 $A(w) = 100w - 2w^2$
Now, find the derivative of $A(w)$ with respect to w : $A'(w) = \frac{dA}{dw} = 100 - 4w$
Set the derivative to zero to find critical points: $100 - 4w = 0$
 $4w = 100$
 $w = 25$ meters
Now, find the corresponding length: $l = 100 - 2w = 100 - 2(25) = 100 - 50 = 50$ meters
To confirm this is a maximum, we can use the second derivative test: $A''(w) = -4$. Since the second derivative is negative, this indicates a maximum.
Explanation: By setting up an area function and finding its maximum using derivatives, we determined the optimal dimensions for the farmer's field. This is a

classic example of optimization in calculus.

Related Rates Problems

Related rates problems involve finding the rate of change of one quantity in terms of the rate of change of another quantity. They often involve geometric shapes and motion.

Problem 11: A spherical balloon is being inflated. The radius is increasing at a rate of 2 cm/s. How fast is the volume of the balloon increasing when the radius is 10 cm?

Solution: The formula for the volume of a sphere is $V = \frac{4}{3}\pi r^3$. We are given $\frac{dr}{dt} = 2$ cm/s (the rate of change of the radius with respect to time). We want to find $\frac{dV}{dt}$ (the rate of change of the volume with respect to time) when $r = 10$ cm. Differentiate the volume formula with respect to time t using the chain rule: $\frac{dV}{dt} = \frac{d}{dt}\left(\frac{4}{3}\pi r^3\right) = \frac{4}{3}\pi \cdot 3r^2 \cdot \frac{dr}{dt}$ (applying the power rule and chain rule) $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$. Now, substitute the given values: $r = 10$ cm and $\frac{dr}{dt} = 2$ cm/s. $\frac{dV}{dt} = 4\pi (10 \text{ cm})^2 (2 \text{ cm/s}) = 4\pi (100 \text{ cm}^2) (2 \text{ cm/s}) = 800\pi \text{ cm}^3/\text{s}$. **Explanation:** We related the rate of change of volume to the rate of change of the radius by differentiating the volume formula implicitly with respect to time.

Unlocking the Power of Change: Differential Calculus Problems with Solutions

Differential calculus, a cornerstone of mathematics, provides the essential tools for understanding and quantifying rates of change. From the instantaneous velocity of a moving object to the marginal cost of production, its applications permeate science, engineering, economics, and beyond. This comprehensive guide delves into various differential calculus problems, offering detailed explanations and step-by-step solutions. Whether you're a student grappling with newfound concepts or a professional seeking to refresh your understanding, this article aims to illuminate the practical power of derivatives.

At its heart, differential calculus is about the derivative. The derivative of a function at a particular point represents the slope of the tangent line to the function's graph at that point. More broadly, it quantifies how a function's output changes in response to infinitesimal changes in its input. Mastering these concepts is crucial for solving complex problems involving optimization, related rates, curve sketching, and much more. Let's begin by exploring foundational problems that build a solid understanding.

Understanding the Fundamentals: The Definition of the Derivative

Before diving into complex scenarios, it's vital to grasp the formal definition of the derivative. The derivative of a function $f(x)$, denoted as $f'(x)$ or $\frac{dy}{dx}$, is defined using the limit of the difference quotient:

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x+h) - f(x)}{h}$$

This definition captures the essence of instantaneous rate of change. The term $\frac{f(x+h) - f(x)}{h}$ represents the average rate of change of the function f over a small interval of width h . As h approaches zero, this average rate of change converges to the instantaneous rate of change.

Problem 1: Finding the Derivative from the Definition

Problem: Use the limit definition to find the derivative of $f(x) = x^2 + 3x$.

Solution:

1. Identify $f(x)$ and $f(x+h)$: $f(x) = x^2 + 3x$ $f(x+h) = (x+h)^2 + 3(x+h) = x^2 + 2xh + h^2 + 3x + 3h$
2. Substitute into the difference quotient: $\frac{f(x+h) - f(x)}{h} = \frac{(x^2 + 2xh + h^2 + 3x + 3h) - (x^2 + 3x)}{h}$
3. Simplify the numerator: $\frac{x^2 + 2xh + h^2 + 3x + 3h - x^2 - 3x}{h} = \frac{2xh + h^2 + 3h}{h}$
4. Factor out h from the numerator: $\frac{h(2x + h + 3)}{h}$
5. Cancel h (since $h \neq 0$): $2x + h + 3$
6. Take the limit as $h \rightarrow 0$: $\lim_{h \rightarrow 0} (2x + h + 3) = 2x + 0 + 3 = 2x + 3$

Therefore, $f'(x) = 2x + 3$.

This foundational problem underscores the concept of limit calculation and its direct link to the derivative. It's an essential stepping stone for understanding more advanced calculus topics.

Mastering Differentiation Rules: Shortcuts to Success

While the limit definition is fundamental, it's often cumbersome. Fortunately, mathematicians have developed a set of powerful differentiation rules that simplify the process significantly. These rules are derived from the limit definition but offer practical shortcuts for various function types.

Understanding and applying these rules efficiently is key to solving a wide array of differential calculus problems.

Common Differentiation Rules:

1. Power Rule: $\frac{d}{dx}(x^n) = nx^{n-1}$
2. Constant Multiple Rule: $\frac{d}{dx}(cf(x)) = c f'(x)$
3. Sum/Difference Rule: $\frac{d}{dx}(f(x) \pm g(x)) = f'(x) \pm g'(x)$
4. Product Rule: $\frac{d}{dx}(u(x)v(x)) = u'(x)v(x) + u(x)v'(x)$
5. Quotient Rule: $\frac{d}{dx}\left(\frac{u(x)}{v(x)}\right) = \frac{u'(x)v(x) - u(x)v'(x)}{(v(x))^2}$
6. Chain Rule: $\frac{d}{dx}(f(g(x))) = f'(g(x)) \cdot g'(x)$

Problem 2: Applying the Power Rule and Sum Rule

Problem: Find the derivative of $g(x) = 5x^4 - 2x^2 + 7$.

Solution:

We can apply the power rule and the sum/difference rule individually to each term:

1. For $5x^4$: Using the constant multiple rule and the power rule, the derivative is $5 \cdot 4x^{4-1} = 20x^3$.
2. For $-2x^2$: Using the constant multiple rule and the power

rule, the derivative is $-2 \cdot 2x^{2-1} = -4x^1 = -4x$.

3. For 7 : The derivative of a constant is 0 .

Combining these results using the sum/difference rule:

$$g'(x) = 20x^3 - 4x + 0 = 20x^3 - 4x.$$

Problem 3: Using the Product Rule

Problem: Find the derivative of $h(x) = (x^3 + 1)(2x - 5)$.

Solution:

Let $u(x) = x^3 + 1$ and $v(x) = 2x - 5$. We need to find their derivatives:

1. $u'(x) = \frac{d}{dx}(x^3 + 1) = 3x^2$

2. $v'(x) = \frac{d}{dx}(2x - 5) = 2$

Now, apply the product rule: $h'(x) = u'(x)v(x) + u(x)v'(x)$

$$h'(x) = (3x^2)(2x - 5) + (x^3 + 1)(2)$$

$$h'(x) = 6x^3 - 15x^2 + 2x^3 + 2$$

$$h'(x) = 8x^3 - 15x^2 + 2.$$

Problem 4: Applying the Quotient Rule

Problem: Find the derivative of $k(x) = \frac{x^2 + 1}{x - 3}$.

Solution:

Let $u(x) = x^2 + 1$ and $v(x) = x - 3$. Their derivatives are:

1. $u'(x) = \frac{d}{dx}(x^2 + 1) = 2x$

2. $v'(x) = \frac{d}{dx}(x - 3) = 1$

Using the quotient rule: $k'(x) = \frac{u'(x)v(x) - u(x)v'(x)}{(v(x))^2}$

$$k'(x) = \frac{(2x)(x - 3) - (x^2 + 1)(1)}{(x - 3)^2}$$

$$k'(x) = \frac{2x^2 - 6x - x^2 - 1}{(x - 3)^2}$$

$$k'(x) = \frac{x^2 - 6x - 1}{(x - 3)^2}.$$

Problem 5: Mastering the Chain Rule

Problem: Find the derivative of $m(x) = \sin(x^3)$.

Solution:

This problem requires the chain rule. Let the outer function be $f(u) = \sin(u)$ and the inner function be $g(x) = x^3$. Their derivatives are:

1. $f'(u) = \frac{d}{du}(\sin(u)) = \cos(u)$
2. $g'(x) = \frac{d}{dx}(x^3) = 3x^2$

Applying the chain rule: $m'(x) = f'(g(x)) \cdot g'(x)$

$$m'(x) = \cos(x^3) \cdot 3x^2 = 3x^2 \cos(x^3).$$

The chain rule is particularly important when dealing with composite functions, often seen in physics and engineering problems involving transformations or nested processes.

Applications of Differential Calculus: Beyond the Textbook

The true power of differential calculus lies in its ability to model and solve real-world problems. Derivatives are the language through which we describe change, and understanding these applications is crucial for a comprehensive grasp of the subject. Some key areas include optimization, related rates, and curve analysis.

Optimization Problems: Finding the Best

Optimization problems involve finding the maximum or minimum values of a function. This is achieved by finding the critical points of the function (where the derivative is zero or undefined) and then using the first or second derivative test to

classify these points.

Problem 6: Maximizing Area

Problem: A farmer wants to fence off a rectangular field adjacent to a river. The field needs to have an area of 1000 square meters. No fencing is needed along the river. What are the dimensions of the field that minimize the amount of fencing required?

Solution:

1. Define variables: Let l be the length of the field parallel to the river and w be the width perpendicular to the river.
2. Formulate equations: Area: $A = l \cdot w = 1000$ Perimeter (fencing): $P = l + 2w$ (since no fence is along the river)
3. Express perimeter in terms of one variable: From the area equation, $l = \frac{1000}{w}$. Substitute this into the perimeter equation: $P(w) = \frac{1000}{w} + 2w$
4. Find the derivative of the perimeter function: $P'(w) = \frac{d}{dw}(1000w^{-1} + 2w) = -1000w^{-2} + 2 = -\frac{1000}{w^2} + 2$
5. Find critical points: Set $P'(w) = 0$. $-\frac{1000}{w^2} + 2 = 0$ $2 = \frac{1000}{w^2}$ $w^2 = 500$ $w = \sqrt{500} = 10\sqrt{5}$ meters (we take the positive root since width must be positive).
6. Use the second derivative test to confirm minimum: $P''(w) = \frac{d}{dw}(-1000w^{-2} + 2) = 2000w^{-3} = \frac{2000}{w^3}$ Since $w = 10\sqrt{5}$ is positive, $P''(10\sqrt{5}) > 0$, indicating a local minimum.
7. Calculate the corresponding length: $l = \frac{1000}{w} = \frac{1000}{10\sqrt{5}} = \frac{100}{\sqrt{5}} = \frac{100\sqrt{5}}{5} = 20\sqrt{5}$ meters.

The dimensions that minimize fencing are $20\sqrt{5}$ meters parallel to the river and $10\sqrt{5}$ meters perpendicular to

the river.

Related Rates Problems: The Interplay of Change

Related rates problems deal with situations where multiple quantities are changing with respect to time, and we need to find the rate at which one quantity is changing given the rates of others. These problems heavily rely on the chain rule and implicit differentiation.

Problem 7: Expanding Balloon

Problem: Air is being pumped into a spherical balloon at a rate of 100 cubic centimeters per second. How fast is the radius of the balloon increasing when the diameter is 50 centimeters?

Solution:

1. Identify variables and rates: Volume V , radius r , time t . Given: $\frac{dV}{dt} = 100 \text{ cm}^3/\text{s}$. We want to find $\frac{dr}{dt}$ when the diameter is 50 cm (so $r = 25$ cm).
2. Formulate an equation relating the variables: The volume of a sphere is $V = \frac{4}{3}\pi r^3$.
3. Differentiate with respect to time (t) using the chain rule:
 $\frac{dV}{dt} = \frac{d}{dt}\left(\frac{4}{3}\pi r^3\right)$
 $\frac{dV}{dt} = \frac{4}{3}\pi \cdot 3r^2 \cdot \frac{dr}{dt}$
 $\frac{dV}{dt} = 4\pi r^2 \frac{dr}{dt}$
4. Substitute known values and solve for $\frac{dr}{dt}$:
 $100 = 4\pi (25)^2 \frac{dr}{dt}$
 $100 = 4\pi (625) \frac{dr}{dt}$
 $100 = 2500\pi \frac{dr}{dt}$
 $\frac{100}{2500\pi} = \frac{dr}{dt}$
 $\frac{1}{25\pi} \text{ cm/s}$

The radius is increasing at a rate of $\frac{1}{25\pi}$ cm/s when the diameter is 50 cm.

Curve Sketching and Analysis

Differential calculus provides invaluable tools for analyzing the behavior of functions and sketching their graphs accurately.

Derivatives help determine:

1. **Critical points:** Where $f'(x) = 0$ or is undefined.
2. **Intervals of increase/decrease:** Determined by the sign of $f'(x)$.
3. **Local maxima/minima:** Using the first or second derivative test.
4. **Concavity:** Determined by the sign of the second derivative, $f''(x)$.
5. **Inflection points:** Where concavity changes, often where $f''(x) = 0$ or is undefined.
6. **Asymptotes:** Lines that the graph approaches.

Problem 8: Analyzing a Cubic Function

Problem: Analyze and sketch the graph of $f(x) = x^3 - 6x^2 + 5x$.

Solution:

1. **Find the first derivative:** $f'(x) = 3x^2 - 12x$.
2. **Find critical points:** Set $f'(x) = 0$. $3x^2 - 12x = 0$ $3x(x - 4) = 0$ Critical points are $x = 0$ and $x = 4$.
3. **Determine intervals of increase/decrease:**
 1. For $x < 0$: $f'(-1) = 3(-1)^2 - 12(-1) = 3 + 12 = 15 > 0$ (increasing).
 2. For $0 < x < 4$: $f'(1) = 3(1)^2 - 12(1) = 3 - 12 = -9 < 0$ (decreasing).
 3. For $x > 4$: $f'(5) = 3(5)^2 - 12(5) = 75 - 60 = 15 > 0$ (increasing).
4. **Find local extrema:** At $x = 0$, the function changes from increasing to decreasing, so there's a local maximum. $f(0) =$

$0^3 - 6(0)^2 + 5 = 5$. Local max at $(0, 5)$. At $x = 4$, the function changes from decreasing to increasing, so there's a local minimum. $f(4) = 4^3 - 6(4)^2 + 5 = 64 - 96 + 5 = -27$. Local min at $(4, -27)$.

5. Find the second derivative: $f''(x) = \frac{d}{dx}(3x^2 - 12x) = 6x - 12$.

6. Find potential inflection points: Set $f''(x) = 0$. $6x - 12 = 0 \implies x = 2$.

7. Determine concavity:

1. For $x < 2$: $f''(1) = 6(1) - 12 = -6 < 0$ (concave down).

2. For $x > 2$: $f''(3) = 6(3) - 12 = 18 - 12 = 6 > 0$ (concave up).

8. Identify inflection point: At $x = 2$, concavity changes. $f(2) = 2^3 - 6(2)^2 + 5 = 8 - 24 + 5 = -11$. Inflection point at $(2, -11)$.

9. Consider end behavior and intercepts: As $x \rightarrow \infty$, $f(x) \rightarrow \infty$. As $x \rightarrow -\infty$, $f(x) \rightarrow -\infty$. Y-intercept: $f(0) = 5$. X-intercepts: Finding roots of $x^3 - 6x^2 + 5 = 0$ requires numerical methods or further analysis.

10. Sketch the graph: Using the information above, sketch a smooth curve passing through the points, respecting the increasing/decreasing intervals and concavity.

Questions & Answers About differential calculus problems with solution

No	Question	Answer
1	I'm struggling with finding the derivative of composite functions. What's the most common pitfall and how can the Chain Rule save me?	The biggest pitfall is forgetting to multiply by the derivative of the inner function. The Chain Rule states that if $y = f(u)$ and $u = g(x)$, then $\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$. Always identify your 'outer' and 'inner' functions and apply the rule systematically.
2	What are implicit differentiation problems, and why do we need a special technique for them?	Implicit differentiation is used when a relationship between x and y is given, but y is not explicitly defined as a function of x (e.g., $x^2 + y^2 = 25$). We need a special technique because we treat y as a function of x and apply the Chain Rule whenever we differentiate a term involving y , remembering that $\frac{d}{dx}(y) = \frac{dy}{dx}$.
3	How can I find the maximum or minimum value of a function using derivatives? What are critical points and how do they relate?	To find maximum or minimum values, we find the critical points of the function, which are the points where the derivative is zero or undefined. These are candidates for local extrema. We then use the First Derivative Test (checking the sign change of the derivative) or the Second Derivative Test (checking the sign of the second derivative) to classify these points as local maxima, minima, or neither.
4	What's the deal with related rates problems? How do I set them up and solve them?	Related rates problems involve finding the rate at which one quantity changes with respect to time, given the rate at which another related quantity changes. The key is to identify the variables, find an equation that relates them, and then differentiate both sides of the equation implicitly with respect to time (t), using the Chain Rule.

5	I keep making mistakes with the product rule and quotient rule. What's a simple way to remember and apply them?	For the product rule (derivative of uv): it's 'first times derivative of second, plus second times derivative of first' or $u'v + uv'$. For the quotient rule (derivative of $\frac{u}{v}$): it's 'low d-high minus high d-low, over the square of what's below' or $\frac{v u' - u v'}{v^2}$. Mnemonics and practice are your best friends here!
6	How do derivatives help us understand the shape of a graph? What do concavity and inflection points tell us?	The first derivative tells us about the slope and whether a function is increasing or decreasing. The second derivative tells us about concavity: if $f''(x) > 0$, the graph is concave up (like a smile); if $f''(x) < 0$, it's concave down (like a frown). Inflection points are where the concavity changes, and they occur where $f''(x) = 0$ or is undefined.
7	What are L'Hôpital's Rule and indeterminate forms? When can I use this powerful tool?	L'Hôpital's Rule is used to evaluate limits of indeterminate forms like $\frac{0}{0}$ or $\frac{\infty}{\infty}$. If $\lim_{x \rightarrow c} \frac{f(x)}{g(x)}$ results in one of these forms, the limit is equal to $\lim_{x \rightarrow c} \frac{f'(x)}{g'(x)}$, provided this latter limit exists. Be sure the conditions are met before applying it!
8	I'm working on optimization problems. What's the general strategy to solve them using calculus?	The general strategy for optimization is: 1. Understand the problem and identify the quantity to be maximized or minimized. 2. Express this quantity as a function of a single variable using any given constraints. 3. Find the critical points of this function by taking its derivative and setting it to zero or finding where it's undefined. 4. Use the first or second derivative test to confirm if the critical point yields a maximum or minimum.

Learning with Differential Calculus Problems With Solution

Learning with Differential Calculus Problems With Solution offers a flexible and structured approach to acquiring knowledge in the digital age. Students, educators, and self-learners can use Differential Calculus Problems With Solution as a primary reference material or as a supplementary resource to support deeper understanding. Its digital format allows learners to study efficiently, organize information, and revisit content whenever necessary.

One of the key advantages of learning with Differential Calculus Problems With Solution is the ability to annotate directly within the document. Highlighting important passages, adding margin notes, and bookmarking chapters help learners actively engage with the material. Active reading techniques like these improve comprehension and long-term retention compared to passive reading alone.

Summarizing chapters is another effective learning strategy when using Differential Calculus Problems With Solution. Learners can create concise summaries or outlines based on highlighted sections and notes. These summaries can be stored separately or within the PDF itself, making revision faster and more organized. Digital note-taking reduces clutter and allows easy updates as understanding improves.

Cross-referencing is also simplified with digital Differential Calculus Problems With Solution.
