Don't Let Hidden Rows Hold You Back: A Comprehensive Guide to Unhiding Rows in Excel

Excel. It's a powerful tool, isn't it? From managing complex budgets to organizing your book collection, it can handle almost anything you throw at it. But sometimes, during the data wrangling process, you might find yourself in a bit of a pickle. You've got rows that have mysteriously disappeared, leaving you wondering, "Where did they go?"

This, my friends, is the magic (or sometimes, the frustration) of hidden rows in Excel. Whether you deliberately hid them to declutter your spreadsheet, or they vanished without a trace, knowing how to unhide rows is a fundamental Excel skill. It's like having a secret weapon in your spreadsheet arsenal, ready to reveal that crucial information you need.

In this comprehensive guide, we're going to dive deep into the world of hidden rows in Excel. We'll cover everything you need to know, from the simplest clicks to more advanced techniques, ensuring you can always bring those elusive rows back into the light. So, grab your favorite beverage, settle in, and let's conquer the art of unhiding rows!

Why Are My Rows Hidden?

Understanding the "Why"

Before we jump into the "how," let's briefly touch upon the "why." Understanding why rows might be hidden can prevent future confusion and help you manage your spreadsheets more effectively.

Common Reasons for Hidden Rows:

1. **Decluttering and Focus:** You might hide rows containing irrelevant or supporting data to focus on the key information. This is particularly useful for large datasets.
2. **Data Security/Privacy:** Sensitive information might be hidden temporarily to prevent unwanted viewing.
3. **Conditional Formatting:** Excel's conditional formatting can sometimes hide rows based on specific criteria, though this is less common than manual hiding.
4. **Filtering:** When you apply filters to your data, Excel effectively hides rows that don't meet your filter criteria. This isn't "hidden" in the same way as manual hiding, but the result is similar – rows disappear.

5. **Accidental Hiding:** It happens to the best of us! Sometimes, a wrong click or a quick shortcut can lead to rows being hidden unintentionally.

Regardless of the reason, the good news is that restoring your hidden rows is usually a straightforward process.

The Simplest Way: Unhiding Rows with Your Mouse

Let's start with the most intuitive and commonly used method. This is your go-to for most situations and is incredibly easy to master.

Method 1: Using the Right-Click Context Menu

This is arguably the fastest and most direct way to unhide rows when you know where to look.

1. **Identify a Gap:** Look at your row numbers. If there are consecutive numbers missing (e.g., you see row 5 followed by row 10), it indicates that rows are hidden between them.
2. **Select the Rows Above and Below:** Click and drag your mouse to select the row immediately *above* the hidden section and the row

immediately **below** the hidden section. For example, if rows 6-9 are hidden, select row 5 and row 10.

3. **Right-Click:** With both rows selected, right-click on the selected row headers (the row numbers themselves).
4. **Choose "Unhide":** From the context menu that appears, simply click on "Unhide."

Voila! Your hidden rows should reappear, filling the gap.

Method 2: The Double-Click Magic

This is another mouse-based trick that's super quick once you get the hang of it.

1. **Locate the Gap:** Again, look for the break in your row numbers.
2. **Hover Over the Border:** Position your mouse cursor over the border between the row **above** the hidden rows and the row **below** them. Your cursor should change into a double-headed arrow, indicating you can resize or reveal.
3. **Double-Click:** Double-click the left mouse button.

Excel is smart enough to recognize this as a command to unhide the rows in that section. This is a

fantastic shortcut for quickly revealing those hidden rows.

Unhiding Rows When You Don't Know Where They Are: The "Select All" Approach

What if you suspect there are hidden rows, but you can't quite pinpoint where the gap is? Or what if you've hidden rows in multiple sections of your spreadsheet and want to reveal them all at once? The "Select All" method is your best friend here.

Method 3: Using the "Select All" Button

This is a powerful way to ensure no row is left hidden in your worksheet.

1. **Click the "Select All" Button:** In the top-left corner of your Excel worksheet, just above the row numbers and to the left of the column letters, there's a small triangle button. Click this button. This action selects your entire worksheet.
2. **Right-Click on Row Headers:** Now, with everything selected, right-click on **any** of the row numbers on the left-hand side of the sheet.

3. **Choose "Unhide":** From the context menu, select "Unhide."

This single action will unhide all rows throughout the entire sheet. It's incredibly efficient for making sure you haven't missed anything. This is a lifesaver when dealing with complex spreadsheets or when you've inherited a workbook from someone else and aren't sure about its history.

Unhiding Rows with Keyboard Shortcuts: For the Power Users

For those who love to live in the keyboard zone, Excel offers efficient shortcuts to unhide rows without touching the mouse. These are great for speed and for maintaining your workflow.

Method 4: The Ribbon Commands

The Excel ribbon provides direct access to the unhide functionality.

1. **Select Rows:** Select the rows around the hidden section, or select the entire sheet by pressing **Ctrl + A** (or **Cmd + A** on Mac).
2. **Navigate to the "Home" Tab:** Ensure you are on the "Home" tab of the Excel ribbon.

3. **Find the "Format" Option:** In the "Cells" group, click on "Format."
4. **Hover Over "Hide & Unhide":** A dropdown menu will appear. Hover your mouse over "Hide & Unhide."
5. **Click "Unhide Rows":** Select "Unhide Rows" from the submenu.

This method is thorough and accessible, even if you're not a seasoned keyboard shortcut user.

Method 5: The Keyboard Shortcut Power Play

This is where things get really speedy. If you've selected rows, you can use this shortcut.

1. **Select Relevant Rows:** Select the row **above** and the row **below** the hidden section, or select the entire sheet (Ctrl + A).
2. **Press: Ctrl + Shift + 9.**

Yes, it's that simple! This shortcut is designed specifically to unhide rows. If you're dealing with frequent hiding and unhiding, memorizing this one will save you a lot of time.

Important Note: This shortcut (Ctrl + Shift + 9) is generally for unhiding **rows**. For unhiding

columns, the shortcut is Ctrl + Shift + 0.

Dealing with Hidden Rows Caused by Filtering

As mentioned earlier, filtering is a common reason why rows might appear to be "hidden." When you apply a filter, Excel doesn't truly hide the rows in the same way as manual hiding; it simply conceals those that don't meet your criteria. However, the visual effect is similar – they're gone from view.

How to Reveal Filtered Rows:

If you've applied filters and want to see all your data again, here's how:

1. **Identify Filtered Columns:** Look for the small filter dropdown arrows in your column headers. If a column has an active filter, the arrow might have a funnel icon.
2. **Clear All Filters:** The quickest way to reveal everything is to clear all active filters. Go to the "Data" tab on the ribbon, and in the "Sort & Filter" group, click the "Clear" button.
3. **Clear Specific Filters:** Alternatively, you can click on the filter dropdown arrow in a specific column

header, and select "Clear Filter From [Column Name]."

4. **Re-apply Filters:** Once you've cleared them, you can then re-apply filters as needed to bring back only the data you want to see.

Understanding the difference between manually hidden rows and filtered rows is key to managing your data effectively. If you've cleared filters and rows are still missing, then it's time to revisit the manual unhiding techniques.

Troubleshooting: What If Unhiding Doesn't Work?

Most of the time, unhiding rows is a breeze. But what if you've tried all the methods and those rows remain stubbornly hidden? Don't despair! Here are a few things to check:

1. **Are They Actually Hidden Rows?** Could the rows be missing due to a data deletion or a formula error? Double-check your row numbers for any breaks.
2. **Frozen Panes:** Sometimes, "frozen panes" can make it seem like rows are missing if they are below the frozen area. Go to the "View" tab, then

"Freeze Panes," and select "Unfreeze Panes."

3. **Protected Sheet:** If the sheet is protected, you might not be able to unhide rows. You'll need to unprotect the sheet first (Password required if it has one). Go to the "Review" tab and click "Unprotect Sheet."
4. **Corrupted Workbook:** In rare cases, a workbook can become corrupted. Try saving your workbook as a new file or copying and pasting your data to a fresh workbook.
5. **Very Large Datasets:** With extremely large datasets, Excel might take a moment to process the unhiding command. Be patient.

Best Practices for Managing Hidden Rows

Now that you're a pro at unhiding rows, let's talk about managing them effectively to avoid future headaches.

1. **Document Your Hiding:** If you're hiding rows for a specific reason (e.g., a report you're preparing), make a note of it. You can use comments on cells or a separate text file.
2. **Use Clear Naming Conventions:** If you're working with multiple sheets or complex data,

descriptive sheet names and clear column headers will always help.

3. **Be Mindful of Shortcuts:** While shortcuts are great, be aware of what you're pressing. A stray Ctrl + Shift + 9 can reveal more than you intended!
4. **Regularly Review Your Sheets:** Especially when collaborating, it's a good practice to periodically unhide all rows (using the Select All method) to ensure no essential data is being missed.

Conclusion: Bring Your Data to Light!

Unhiding rows in Excel might seem like a small thing, but it's a crucial skill that can save you a lot of time and prevent a lot of frustration. Whether you prefer the simple click of a mouse, the elegance of a keyboard shortcut, or the comprehensive power of "Select All," you now have a robust toolkit at your disposal.

Remember the different methods: the context menu, the double-click, the select all button, the ribbon commands, and the keyboard shortcut. And don't forget to distinguish between manually hidden rows and those hidden by filters.

So, the next time those rows go missing, you'll know

exactly what to do. Go forth and unhide with confidence, and ensure all your valuable data is always visible when you need it most!

Understanding How to Unhide Rows in Excel: A Comprehensive Guide

Hiding rows in Excel is a common task that helps users manage large datasets by temporarily concealing less relevant information. Yet, there are times when you need to reveal hidden rows to analyze, cross-reference, or present data more effectively. Whether due to filtering, manual hiding, or formatting quirks, knowing how to unhide rows is essential for efficient spreadsheet navigation and data handling. When rows are hidden, it's typically because of the Filter feature, which masks rows that don't meet specific criteria. Alternatively, rows might be hidden manually by selecting them and choosing "Unhide" from the context menu—or via the "Home" tab's "Format" group. However, Excel's unhide rows functionality goes beyond just restoring visibility; it's a gateway to uncovering hidden relationships in data and improving workflow clarity.

The Mechanics of Unhiding Rows in Excel

To unhide rows, Excel relies on a structured system based on row heights and hidden row markers. When a row is hidden, Excel doesn't erase it—it simply shifts the remaining rows upward to fill the gap. This creates visible space where no data exists, but the underlying structure remains intact. To reveal these rows, users must identify the hidden row's position and expand the spreadsheet vertically. The most straightforward way is to access the "Format" menu: select the rows above and below the hidden section, right-click, and choose "Unhide." This method works reliably in most versions of Excel, especially when rows are contiguous. For non-contiguous selections or more granular control, navigating to the "Home" tab and clicking the "Format" dropdown under the "Cells" group allows invoking the unhide option with additional formatting options. Alternatively, keyboard shortcuts—like selecting the row above and below, then pressing Ctrl + Shift + Down (or upward)—can trigger the process quickly, saving time in large datasets.

Key Insights and Practical Applications

Unhiding rows isn't just about visibility—it's about restoring context. In financial reporting, hidden rows may conceal specific transaction details that are critical for audit trails. In project management, rows might be hidden to focus on active phases, but revealing them becomes necessary during progress reviews or stakeholder presentations. Educators and researchers often hide data during initial analysis to avoid clutter, only to unhide rows when comparing subsets or identifying outliers. This functionality also supports dynamic data modeling, where users build interactive dashboards or pivot tables that require toggling visibility of entire row segments. By mastering row unhiding, users gain greater flexibility in organizing and interpreting data, transforming static spreadsheets into responsive analytical tools.

Maximizing Benefits and Future Outlook

The ability to unhide rows enhances productivity by reducing the need for manual data sorting or copying and pasting to reveal information. As Excel continues to evolve with new features like dynamic named ranges and AI-assisted data insights, the underlying

unhide capability remains foundational yet increasingly integrated. With advancements in automation and user interface design, future versions may offer smarter, context-aware unhide prompts—such as suggesting which rows to unhide based on filtering patterns or data trends. However, the core principles of row unhiding remain unchanged: understanding hidden row markers, using keyboard shortcuts efficiently, and preserving data integrity during the process. For professionals who rely on precise data manipulation, mastering this seemingly simple task unlocks deeper control and insight, ensuring that no critical information is left out of sight. In essence, unhiding rows in Excel is more than a technical step—it's a gateway to clearer, more insightful data exploration. With practice, it becomes second nature, empowering users to navigate complex datasets with confidence and precision.

Unveiling Hidden Truths: A Comprehensive Guide on How to Unhide Rows in Excel

Microsoft Excel, a cornerstone of data management

and analysis, offers a powerful feature for tidying up spreadsheets: hiding rows. Whether you're trying to focus on specific data points, present information concisely, or simply declutter a vast dataset, hiding rows can be an indispensable tool. However, the flip side of this functionality is the need to bring those hidden rows back into view. This guide will delve deep into the various methods of how to unhide rows in Excel, offering detailed, step-by-step instructions and illuminating the underlying principles for both novice and experienced users. We'll explore efficient techniques, troubleshoot common issues, and provide SEO-friendly insights to ensure you can confidently navigate this essential Excel skill.

Understanding how to unhide rows is crucial for data integrity and accessibility. Without this knowledge, valuable information can remain obscured, leading to incomplete analysis or misinterpretations.

Fortunately, Excel provides multiple, user-friendly approaches to reveal hidden data, catering to different scenarios and user preferences. From simple mouse-driven actions to keyboard shortcuts and specialized commands, mastering these techniques will significantly enhance your spreadsheet proficiency.

Why Do We Hide Rows in Excel?

Before we dive into the "how," it's beneficial to briefly touch upon the "why." Hiding rows in Excel is not merely an aesthetic choice; it serves practical purposes:

1. **Data Focus:** Isolating specific data for analysis or presentation by temporarily removing irrelevant information.
2. **Report Generation:** Streamlining reports by excluding extraneous details, making the key figures stand out.
3. **Comparison:** Hiding rows to compare specific datasets side-by-side without visual clutter.
4. **Security/Privacy:** Masking sensitive information without deleting it, for collaborative environments.
5. **Performance:** In extremely large spreadsheets, hiding rows can sometimes improve performance by reducing the amount of data Excel needs to render.

Method 1: The Simplest Approach - Using the Mouse

The most intuitive method for unhiding rows involves using your mouse and the Excel interface. This is often the go-to for quick unhiding tasks.

Unhiding Adjacent Hidden Rows

If the hidden rows are grouped together (i.e., there's a visible gap between two numbered rows, indicating one or more hidden rows in between), this method is incredibly efficient.

1. **Identify the Gap:** Look at the row numbers in the left-hand margin. You'll see a double-headed arrow or a thicker line where rows are hidden.
2. **Hover and Click:** Position your mouse cursor over this gap. The cursor will transform into a double-headed arrow (pointing up and down).
3. **Double-Click:** Double-click the left mouse button. All immediately adjacent hidden rows will reappear.

This is arguably the fastest way to unhide a contiguous block of rows. It's a visual cue that most users quickly pick up.

Unhiding Non-Adjacent or All Hidden Rows Using the Mouse

When hidden rows are not adjacent, or you want to unhide everything in a worksheet, a slightly different approach is needed.

1. **Select the Entire Sheet:** Click the "Select All"

button. This is the small, triangular button located in the top-left corner of the worksheet, where the row headers and column headers meet.

Alternatively, you can press **Ctrl + A** (or **Cmd + A** on Mac) twice. The first press selects the current region, and the second selects the entire worksheet.

2. **Right-Click:** Once the entire sheet is selected, right-click anywhere within the selected area.
3. **Choose "Unhide":** From the context menu that appears, select the "Unhide" option.

This method is excellent for ensuring no hidden rows are left behind. It's a comprehensive way to reveal all obscured data in your active worksheet.

Method 2: Leveraging the Ribbon for Unhiding Rows

Excel's ribbon provides a structured and accessible way to perform various actions, including unhiding rows. This method is particularly useful for those who prefer navigating through menus.

Unhiding Rows via the Format Menu

This approach involves using the "Format" option within the "Cells" group on the "Home" tab.

1. **Select Relevant Rows:** To unhide specific rows, you need to select rows that are above and below the hidden ones, or select the entire sheet if you want to unhide everything. Click and drag to select multiple rows, or use the "Select All" button.
2. **Navigate to the Ribbon:** Go to the **Home** tab.
3. **Locate the "Format" Option:** In the "Cells" group, click on the **Format** dropdown.
4. **Hover over "Hide & Unhide":** From the dropdown menu, hover your mouse over **Hide & Unhide**.
5. **Select "Unhide Rows":** Click on **Unhide Rows**.

This method is very explicit and visually clear, making it easy to follow even for users less familiar with Excel's shortcuts.

Unhiding Rows via the View Tab (for specific scenarios)

While primarily used for unhiding columns, the "View" tab can also be indirectly helpful in locating hidden rows if you're also dealing with hidden columns.

1. **Go to the View Tab:** Click on the **View** tab in the Excel ribbon.
2. **Find the "Windows" Group:** Look for the

"Windows" group.

3. **Click "Unhide":** While there isn't a direct "Unhide Rows" button here, if you have a split window or frozen panes, you might find options related to unhiding elements. However, for row unhiding specifically, the "Home" tab method is more direct.

It's important to note that the "View" tab's "Unhide" functionality is more commonly associated with unhiding windows or sheets, rather than individual rows within a sheet. For row manipulation, the "Home" tab is the primary location.

Method 3: Keyboard Shortcuts - The Power User's Choice

For those who want to maximize their efficiency, keyboard shortcuts are invaluable. They eliminate the need to move your mouse and navigate through menus, allowing for rapid execution of commands.

Unhiding All Rows with Keyboard Shortcuts

This is a swift and effective way to reveal all hidden rows in your current worksheet.

1. **Select the Entire Sheet:** Press **Ctrl + A** (or **Cmd + A** on Mac). Repeat pressing **Ctrl + A** until the

entire sheet is selected.

2. **Access the Format Menu:** Press **Alt + H** (to go to the Home tab), then **O** (for Format), then **U** (for Unhide), then **R** (for Rows). So, the sequence is **Alt + H + O + U + R**.

This sequence might seem like a lot, but with practice, it becomes second nature and significantly speeds up the process.

Unhiding Specific Rows with Keyboard Shortcuts

This is slightly more involved but still achievable through keyboard commands.

1. **Select Rows Above and Below Hidden Rows:**
Use the arrow keys and **Shift** to select the rows immediately above and below the hidden section you wish to reveal.
2. **Access the Format Menu:** Press **Alt + H + O + U + R** as described above.

Alternatively, if you know the row numbers, you can select a range that encompasses the hidden rows. For instance, if rows 10-20 are hidden, and you want to unhide them, you can select row 9 and row 21, and then use the unhide command. Excel will then unhide anything in between.

Method 4: Using the Name Box

The Name Box, located to the left of the formula bar, is another powerful tool for navigating and selecting ranges, which can be leveraged for unhiding rows.

1. **Identify the Range of Hidden Rows:** If you know the specific row numbers that are hidden (e.g., rows 5 through 10), you can use this information.
2. **Type the Range in the Name Box:** Click on the Name Box and type the range that includes the hidden rows and at least one row above and below them. For example, to unhide rows 5-10, you might type **4:11** (assuming rows 4 and 11 are visible). Press Enter.
3. **Unhide:** Once this range is selected, you can then right-click and choose "Unhide" or use the ribbon/keyboard shortcuts as described in previous methods.

This method is particularly useful when dealing with large gaps or when you need to be precise about which hidden rows you are targeting.

Troubleshooting Common Issues When Unhiding Rows

Despite the straightforward nature of these methods,

you might encounter a few snags. Here are some common problems and their solutions:

1. "Unhide" Option is Grayed Out

This typically happens for a few reasons:

1. **No Rows Selected:** Ensure you have selected at least one visible row above and one visible row below the hidden rows, or that you have selected the entire sheet. If only hidden rows are selected, Excel might not know what context to unhide within.
2. **Protected Sheet:** If your worksheet is protected with a password that prevents row manipulation, the "Unhide" option will be disabled. You'll need to unprotect the sheet first (**Review** tab > **Unprotect Sheet**).
3. **Hidden Sheet:** If the entire sheet itself is hidden (not just rows), you'll need to unhide the sheet first. Right-click on any sheet tab, and select "Unhide."

2. Only Some Rows Unhide

This usually indicates that the rows were hidden in separate groups. If you used the double-click method on a gap, it only unhides the immediately adjacent hidden rows. For comprehensive unhiding, always

resort to selecting the entire sheet or a range that encompasses all potentially hidden rows.

3. Can't Find the Hidden Rows

Sometimes, especially in complex spreadsheets, it can be hard to visually pinpoint where rows are hidden. A good strategy is to:

1. **Select the Entire Sheet:** This is the most foolproof way to ensure all hidden rows are brought back.
2. **Use "Go To Special":** Press **Ctrl + G** (or **F5**) to open the "Go To" dialog box. Click the "Special" button. Select "Visible cells only" (this might seem counterintuitive, but when used after selecting the entire sheet and then applying an unhide command, it helps refresh the view). A more direct application of "Go To Special" for finding hidden items is less about unhiding and more about selecting visible cells after an unhide operation. For simply finding hidden rows, selecting the whole sheet and unhiding is more effective.

Best Practices for Managing Hidden Rows

To make your spreadsheet management more

efficient, consider these best practices:

1. **Document Hidden Data:** If you hide rows containing important information, consider adding a comment or a note on an adjacent visible cell explaining that data is hidden and where it can be found, or for what purpose it was hidden.
2. **Use Clear Naming Conventions:** For workbooks with many sheets, clearly name your sheets so you know what data is contained within, making it easier to identify where hidden rows might be relevant.
3. **Regularly Review Hidden Data:** Periodically unhide all rows to ensure no critical data has been accidentally obscured or lost.
4. **Consider Grouping:** For related sections of data that you frequently hide and unhide, consider using Excel's "Group" feature (**Data** tab > **Group**). This creates collapsible sections with +/- buttons that are more intuitive for toggling visibility than manual hiding/unhiding.

Conclusion: Mastering the Art of Revelation in Excel

Unhiding rows in Excel is a fundamental skill that empowers users to control the visibility of their data,

enhance readability, and perform focused analysis. Whether you prefer the directness of the mouse, the structured approach of the ribbon, or the speed of keyboard shortcuts, Excel offers a method to suit every user. By understanding the various techniques and common troubleshooting steps, you can confidently navigate the landscape of hidden data, ensuring that your spreadsheets remain transparent, manageable, and insightful. Remember to practice these methods regularly, and you'll soon find yourself effortlessly revealing hidden truths within your Excel workbooks.

If you're unsure where the rows are, select the entire sheet (Ctrl+A) and then right-click and 'Unhide'.
2	I've got a massive spreadsheet with hidden rows. What's the fastest way to reveal them all?	For a large sheet, the most efficient method is to select the entire worksheet by clicking the triangle in the top-left corner (between the 'A' column header and '1' row header). Then, right-click anywhere on the selected area and choose 'Unhide' from the context menu. This will reveal all hidden rows and columns.
3	I see a double-lined row separator, but I can't unhide the rows. What am I doing wrong?	A double-lined separator often indicates that there are hidden rows between the visible ones. To unhide them, place your cursor over the double line. Your cursor should change to a double-headed arrow. Click and drag upwards to reveal the hidden rows. If that doesn't work, try selecting the rows above and below the suspected hidden ones and right-clicking to 'Unhide'.

4	Can I unhide specific rows in Excel without affecting others?	Yes, you can! If you know the exact row numbers that are hidden, you can select them directly. For instance, if rows 5 through 10 are hidden, select row 5, hold down the Ctrl key, and then select row 10. Then, right-click and choose 'Unhide'. Alternatively, you can select the rows above and below the hidden ones, right-click, and choose 'Unhide'.
5	My hidden rows are gone, but now my Excel sheet is messed up. How do I ensure everything is visible?	To ensure all rows are visible, the best approach is to select the entire worksheet (Ctrl+A or the top-left triangle). Then, right-click and select 'Unhide'. This guarantees all hidden rows and columns are brought back into view, resetting the sheet's layout.
6	I accidentally hid a row and can't find the unhide option. Where is it?	The 'Unhide' option appears when you right-click on a selection. Make sure you've selected the rows <i>*above*</i> and <i>*below*</i> where you believe the hidden row is. If you're unsure, select the entire sheet and right-click, then look for 'Unhide' in the context menu. It might also be available under the 'Format' options in the 'Cells' group on the Home tab.

7	Is there a keyboard shortcut to unhide rows in Excel?	While there isn't a direct, single shortcut for unhiding all rows, you can use a combination. Select the entire sheet (Ctrl+A), then press `Alt + H + O + U + R` (for Home -> Format -> Hide & Unhide -> Unhide Rows). This sequence opens the 'Unhide Rows' command.
8	Why can't I unhide rows in my Excel sheet sometimes? It's greyed out!	The 'Unhide' option can be greyed out if you haven't made the correct selection. Ensure you are right-clicking on the row numbers themselves, or on the row headers. If you're trying to unhide specific rows, select the row above and the row below the hidden ones. If the entire sheet is protected, you might also need to unprotect it first before you can unhide rows.
