Unearthing the Past: How to Find Old Gold Mines Using Tengraph Online

The allure of forgotten riches, the romance of prospecting, and the thrill of discovery – these are the siren songs that draw many to the idea of finding old gold mines. Perhaps you've heard whispers of a lost prospector's claim, stumbled upon an antique map, or simply possess a deep fascination with the gold rushes of yesteryear. Whatever your motivation, the journey to locating these historical sites can be incredibly rewarding. And in today's digital age, there's a powerful tool at your fingertips: Tengraph Online. For those new to the world of mineral exploration and historical land records, the thought of using a specialized online platform might seem daunting. But fear not! This comprehensive guide will walk you through the process, demystifying Tengraph Online and equipping you with the knowledge to embark on your own treasure hunt for old gold mines. We'll cover everything from understanding what Tengraph is to practical tips for navigating its wealth of information.

What is Tengraph Online?

Tengraph Online is essentially the digital gateway to Western Australia's mineral and petroleum tenement system. Managed by the Department of Mines, Industry Regulation and Safety (DMIRS), it's a sophisticated database that holds a vast amount of information about land parcels, exploration licenses, mining leases, and other related exploration activities. Think of it as the ultimate historical registry for anything related to mining in WA. While Tengraph Online is primarily used by exploration companies and geologists for current and prospective mineral exploration, its historical data makes it an invaluable resource for amateur prospectors, historians, and anyone interested in locating past mining operations. It's a treasure trove of information that, with a little digging, can reveal the locations of long-abandoned gold mines.

Why Use Tengraph Online for Finding Old Gold Mines?

The beauty of Tengraph Online lies in its comprehensive nature. It records applications for exploration and mining rights, approvals, and even relinquishments. This means that even if a mine was worked extensively and then abandoned decades ago, the land it occupied was likely subject to mining tenements at some point. Tengraph Online allows you to trace these historical land use patterns. Unlike simply looking at old maps (which can be inaccurate or incomplete), Tengraph provides official, georeferenced data. This means you can pinpoint locations with a high degree of accuracy, overlaying historical tenement information onto current maps. This precision is crucial when searching for elusive mine sites, especially in vast and often remote areas of Western Australia. Furthermore, Tengraph Online often contains information about the type of mineral sought. While it's predominantly used for current exploration, historical records can sometimes indicate if a tenement was applied for or held for gold. This helps narrow down your search considerably.

Getting Started with Tengraph Online: A Step-by-Step Approach

Navigating Tengraph Online for the first time can feel like stepping into a complex digital library. However, by breaking it down into manageable steps, you'll find it more accessible than you might imagine.

Step 1: Accessing Tengraph Online

The first hurdle is simply getting to the platform. A quick search for "Tengraph Online Western Australia" will lead you to the official DMIRS website. Look for the section dedicated to their online services. You'll likely need to accept their terms and conditions to proceed. There's no cost to access the public version of Tengraph, which is more than sufficient for our purposes.

Step 2: Understanding the Interface and Key Tools

Once you're in, you'll be greeted by a map interface, similar to Google Maps but with a lot more layers of geological and administrative information. Take some time to familiarize yourself with the basic navigation: zooming in and out, panning across the map, and identifying the various icons and legends. Key tools you'll want to get acquainted with include:

- * **Base Map Options:** You can often switch between different base maps, such as satellite imagery, topographical maps, or standard street maps, which can be helpful for orientation.
- * **Layer Control:** This is where the magic happens. You'll be able to toggle various data layers on and off. For finding old gold mines, you'll be particularly interested in layers related to historical tenements.
- * **Search Functionality:** Tengraph usually has a robust search function where you can input specific details like tenement numbers, names (if you have any leads), or geographical areas.
- * **Query/Selection Tools:** These tools allow you to click on specific areas or draw shapes on the map to select and retrieve information about the tenements within that selection.

Step 3: Identifying Relevant Data Layers for Gold Mining

This is where your treasure hunt truly begins. You need to find the layers that will show you where gold mining activities might have occurred. While the exact naming conventions can change slightly over time, you'll want to look for layers that represent:

- * **Historical Tenements:** This is your primary target. You're looking for tenements that were active in the past. The system might categorize these by their status (e.g., "granted," "expired," "relinquished").
- * **Mining Leases (MLs) and Prospecting Licenses (PLs):** These are the most relevant types of tenements for actual mining or prospecting. Exploration Licenses (ELs) are more for broad exploration and might not indicate specific mine sites, but they can sometimes lead you to areas of interest.
- * **Geological Information:** Layers showing geological formations known to host gold deposits can be incredibly useful. If you can overlay historical tenements with known gold-bearing geology, you're significantly increasing your chances of finding something.

Step 4: Narrowing Down Your Search Area**

Unless you have a specific historical record pointing to a particular farm or valley, you'll need a strategy to narrow down the vast expanse of Western Australia. * **Research Historical Gold Rushes:** Western Australia has a rich gold history, with major rushes in areas like the Yilgarn Craton (think Kalgoorlie, Coolgardie, Leonora) and the Murchison. Researching the history of these regions can give you geographical starting points. * **Utilize Local Knowledge:** Talk to long-time residents, local historical societies, or even experienced prospectors in the areas you're interested in. They might have anecdotal evidence of old workings that predate official records or were too small to be extensively documented. * **Focus on Known Gold-Bearing Areas:** Use geological maps (which can often be accessed through or linked from the DMIRS website) to identify areas with known gold mineralization. Then, overlay this with historical tenement data on Tengraph.

Step 5: Querying and Analyzing Tenement Data**

Once you've identified potential areas of interest on the map and selected the relevant historical tenement layers, it's time to query the data. * **Click and Explore:** Use the selection tools to click on individual tenement polygons. A pop-up window or a separate information panel should appear, providing details about that tenement. * **Look for Gold-Related Keywords:** In the tenement details, look for any mention of "gold," "auriferous," or specific mine names if you have any leads. Even if it just says "all minerals," it's worth investigating further if it's in a known gold-producing region. * **Check Tenement Status and Dates:** Pay attention to the tenement's status (e.g., "expired," "relinquished") and the dates it was active. This will help you understand if the mining activity is likely to have occurred in the past. * **Export Data (if available):** Some versions of Tengraph might allow you to export data for specific areas. This can be helpful for offline analysis or for importing into other mapping software if you're more technically inclined.

Step 6: Cross-Referencing with Other Resources**

Tengraph Online is a powerful tool, but it's not the only one. To maximize your chances of success, cross-reference the information you find with other resources. * **Geological Survey of WA (GSWA) Publications:** The GSWA website is a goldmine (pun intended!) of geological maps, reports, and mineral occurrence databases. These can provide detailed information about gold deposits and historical mines that might not be explicitly captured in tenement records. * **Historical Maps and Newspapers:** Old topographical maps, mining warden reports, and local newspaper archives can offer invaluable clues. Old maps might depict mine shafts or workings that are no longer visible, and newspaper articles can detail prospecting activities and discoveries. * **Local Museums and Historical Societies:** These institutions often have local knowledge, artifacts, and photographic records related to past mining operations.

Tips for Success and What to Expect

Finding old gold mines is rarely a straightforward, point-and-click operation. It requires patience, persistence, and a bit of detective work. * **Be Patient:** Tengraph Online is a vast system. It will take time to learn its nuances and to sift through the data. * **Start Broad, Then Narrow Down:** Don't expect to find a specific mine on your first try. Begin with a general area of interest and gradually refine your search based on the information you uncover. * **Understand Tenement Boundaries:** Remember that tenement boundaries are often large. A tenement might cover a broad area, and the actual mine workings might be a small part of it. * **Not All Tenements Mean Mines:** Just because a tenement existed doesn't guarantee a mine was established. It could have been for exploration only, or the prospectors may have never found payable gold. * **Safety First:** If you do locate a potential mine site, remember that old mine workings can be extremely dangerous. Unstable shafts, hazardous ground, and unseen pits are common. Always prioritize your safety and do not enter any old mine workings. Informing relevant authorities is also a good practice. *

****Respect the Land:**** Always seek permission before venturing onto private property, and be mindful of environmental regulations and heritage sites.

Beyond Tengraph: Other Digital Avenues**

While Tengraph Online is our primary focus, other digital resources can complement your search: * ****Google Earth/Maps:**** Use satellite imagery to visually scout areas identified through Tengraph, looking for subtle signs of past human activity like overgrown tracks, disturbed ground, or even remnants of old structures. * ****Online Archives of Historical Records:**** Many state and national libraries have digitized historical newspapers and government gazettes, which can be invaluable for researching historical mining activities. **### The Thrill of Discovery**** Using Tengraph Online to find old gold mines is more than just a digital exercise; it's an expedition into Western Australia's rich and fascinating past. It's about connecting with the pioneers who ventured into the bush, driven by the dream of striking it rich. By leveraging the power of this online platform, you're not just looking for gold; you're unearthing stories, uncovering history, and perhaps, just perhaps, stumbling upon a forgotten piece of Australia's golden heritage. So, dive in, explore, and happy hunting!

Exploring the Legacy of Old Gold Mines with Tengraph Online The quest for untold gold treasures buried beneath the Earth's surface has captivated explorers and prospectors for centuries. While traditional methods often rely on historical records and surface clues, modern technology offers powerful new tools to uncover hidden gold mine sites—Tengraph Online standing out as a transformative platform in this endeavor. By harnessing advanced geospatial data, Tengraph enables researchers, geologists, and treasure hunters alike to identify potential old gold mine locations with unprecedented precision and efficiency.

Understanding Old Gold Mines and Their Hidden Clues

Old gold mines are remnants of historical extraction efforts, often marked by telltale signs such as quartz veins, altered rock formations, abandoned shafts, and remnants of processing equipment. These sites, though sometimes obscured by vegetation or terrain, hold vital geological and structural indicators of gold deposits. Traditional prospecting methods require extensive fieldwork and can be time-consuming and costly. However, with Tengraph Online, users gain access to layered geospatial data that reveal subsurface patterns invisible to the naked eye—patterns shaped by past mining activity and geological processes.

Leveraging Tengraph Online to Locate Abandoned Gold Mines

Tengraph Online integrates satellite imagery, geological surveys, and topographic data into an intuitive, interactive platform designed for exploration. Users begin by accessing high-resolution terrain maps overlaid with historical mining records, mineral composition layers, and structural fault lines. These features help pinpoint regions where gold-bearing quartz veins and other mineral signatures are likely to occur. By analyzing elevation changes, drainage patterns, and rock formations, researchers can trace ancient mining routes and identify anomalies consistent with past extraction. The platform's advanced visualization tools allow users to drill down into specific zones, revealing subsurface structures that may conceal old mine entrances or ore-rich zones.

Key Insights for Effective Exploration One powerful insight offered by Tengraph is its ability to detect subtle anomalies in rock density and soil composition—signs often associated with buried gold deposits and historical mining disturbances. When combined with historical maps and oral histories, these data points form a compelling narrative of past activity. Geologists note

that gold mines frequently align with tectonic fault lines or hydrothermal zones, where mineral-rich fluids once flowed. Tengraph's integration of geological datasets helps map these zones with greater accuracy, narrowing search areas and reducing guesswork.

Applications Beyond Discovery: From Heritage to Resource Development

The use of Tengraph Online extends beyond mere treasure hunting. For heritage preservation, it aids in locating and documenting old gold mine sites, safeguarding cultural and historical legacies. For mining companies, identifying abandoned mines offers opportunities for reprocessing under modern environmental standards, recovering residual gold without new excavation. Researchers benefit from improved data-driven models that enhance understanding of gold formation and migration, enriching both academic studies and practical exploration. Furthermore, the platform supports sustainable development by enabling targeted investigation, minimizing unnecessary land disturbance, and aligning exploration with environmental stewardship. As regulatory scrutiny increases, Tengraph's transparent, data-backed findings provide credible evidence for compliance and stakeholder engagement.

Benefits of Using Tengraph for Old Gold Mine Detection

The benefits of employing Tengraph Online are substantial. Its cloud-based architecture ensures accessibility from any location, empowering remote teams and independent researchers alike. The platform's seamless integration with existing geological datasets ensures comprehensive analysis without data siloing. By automating spatial analysis and pattern recognition, Tengraph accelerates the identification process, cutting down weeks or months of manual surveying. This efficiency translates into cost savings, faster project timelines, and more strategic allocation of field resources. Moreover, Tengraph fosters collaboration—sharing findings across teams and institutions builds collective knowledge, accelerating discovery and preservation efforts. Its user-friendly interface ensures that even those with limited technical expertise can navigate

complex geospatial data, democratizing access to critical exploration tools.

The Future of Gold Exploration with Tengraph Online

Looking ahead, the convergence of geospatial technology and historical exploration is poised to revolutionize gold mining. As machine learning and AI enhance pattern recognition capabilities, Tengraph is expected to deliver even more precise predictive models, identifying not just old mine sites but entire prospective mineral belts. Integration with real-time environmental sensors could further refine targeting, ensuring exploration respects ecological boundaries. The rise of open-access data platforms, combined with growing public interest in gold's historical and geological significance, suggests increasing demand for tools like Tengraph. These innovations empower a new generation of explorers—whether scientists, entrepreneurs, or history enthusiasts—to uncover Earth's hidden treasures responsibly and sustainably. In essence, Tengraph Online is more than a mapping tool; it is a gateway to reconnecting with the past while building a smarter, more informed future for gold exploration. By unlocking the secrets buried beneath the surface, it transforms the ancient hunt for gold into a modern, data-driven journey of discovery.

Unearthing History: How to Find Old Gold Mines Using Tengraph Online

The allure of gold has captivated humanity for millennia, inspiring tales of fortune, adventure, and the relentless pursuit of buried treasure. While modern-day prospectors often rely on advanced technology and extensive geological surveys, the ghost towns and forgotten claims of yesteryear hold a significant amount of historical and, potentially, mineralogical interest. For those with a

passion for history, geology, or even a touch of adventurous spirit, the question arises: how can one effectively locate these remnants of past gold rushes? The answer, increasingly, lies within the digital realm, specifically through the powerful and comprehensive resource known as Tengraph Online.

Tengraph Online, a digital platform managed by various geological surveys and government departments (most notably in Australia), acts as a vast repository of information pertaining to mineral exploration, mining leases, historical mine sites, and geological data. It's an invaluable tool for researchers, geologists, historians, and amateur prospectors alike. This article will delve deep into the intricacies of using Tengraph Online to pinpoint old gold mines, transforming historical records into actionable geographical locations.

The Power of Tengraph Online: More Than Just a Map

At its core, Tengraph Online is a Geographic Information System (GIS) that overlays various datasets onto a map interface. This isn't just about seeing property boundaries or geological formations; it's about accessing a rich tapestry of information that has been meticulously collected over decades, and in some cases, centuries. When it comes to finding old gold mines, Tengraph offers several key advantages:

1. **Historical Mining Tenements:** Tengraph meticulously records past and present mining licenses, leases, and claims. These historical tenements are often directly correlated with known gold-producing areas.
2. **Geological Data:** Overlaying geological maps with mining data allows users to identify areas where gold-bearing formations are present and where historical mining activity has occurred.
3. **Topographical Information:** Understanding the terrain is crucial for both historical mining operations and modern exploration. Tengraph provides detailed topographical maps.
4. **Historical Records and Reports:** While not always directly embedded,

Tengraph often links to or references historical reports, geological surveys, and anecdotal evidence that can provide further clues.

Getting Started: Navigating the Tengraph Interface

Accessing Tengraph Online is typically straightforward. Most geological survey websites provide a public-facing portal. The interface generally involves a map viewer, a search function, and a layer control panel. For the purpose of finding old gold mines, you'll want to familiarize yourself with the following:

1. Understanding the Data Layers

The true power of Tengraph lies in its ability to display multiple data layers simultaneously. When searching for old gold mines, you'll want to enable and examine layers such as:

1. **Mineral Tenements (Historical and Current):** This is your primary layer. Look for areas that were historically pegged for gold mining. Pay attention to the status of these tenements – expired, forfeited, or relinquished leases are prime indicators of past activity.
2. **Geological Maps:** Identify areas with geological formations known to host gold, such as quartz veins, alluvial deposits, or specific rock types. Cross-referencing these with mining tenements is a critical step.
3. **Drillhole Data:** While more advanced, drillhole data can reveal the extent and depth of past exploration and mining efforts. Look for historical drilling within areas of interest.
4. **Topography and Contours:** Historically, gold miners often worked in areas with specific topographical features, such as gullies, creek beds (for alluvial gold), or hillsides with exposed quartz.
5. **Existing Mines (Active and Abandoned):** While you're looking for *old* mines, the presence of current or recently closed mines can indicate a wider goldfield that may have older, less documented workings nearby.

2. Effective Search Strategies

Simply browsing the map can be time-consuming. Tengraph Online offers sophisticated search functionalities that can significantly streamline your investigation:

1. **Search by Location:** If you have a general idea of a historical gold rush area, you can zoom into that region.
2. **Search by Mineral Type:** Many Tengraph systems allow you to filter tenements or exploration licenses by the minerals they were targeting. Select "Gold" to narrow your search.
3. **Search by Tenement Status:** Focus on tenements that are no longer active. Expired, forfeited, or surrendered leases are strong indicators of areas that were once prospected or mined.
4. **Keyword Searches:** Some advanced versions of Tengraph may allow for keyword searches within associated reports or tenement descriptions. Look for terms like "alluvial gold," "quartz reef," "sluicing," or specific historical mining company names.

From Digital Clues to Real-World Discovery: Advanced Techniques

Using Tengraph Online effectively involves more than just clicking on layers. A strategic approach will yield better results.

Identifying Historical Goldfields

The first step is often to identify known historical goldfields. Many geological surveys have published historical summaries or maps of gold production areas. Tengraph can then be used to delve deeper into the specifics of these regions.

1. **Cross-Referencing with Historical Maps and Records:** While Tengraph is digital, its information is often a digitized version of older paper records. For richer context, compare Tengraph data with scanned historical maps,

newspaper archives detailing gold finds, and geological survey publications from the gold rush era. Websites like Trove (for Australia) can be invaluable for this.

2. **Understanding Alluvial vs. Hard Rock Mining:** Tengraph data will often indicate the type of mining. Alluvial gold was found in creek beds and alluvial deposits, often involving sluicing and panning. Hard rock mining involved excavating quartz reefs or lodes. Topographical layers are particularly useful for identifying potential alluvial sites (creeks, terraces) and hard rock sites (hillsides, exposed reefs).
3. **Analyzing Tenement Density and History:** Look for areas with a high concentration of historical gold mining tenements. A dense cluster of expired leases suggests intense historical activity. Examine the duration of these leases – a short duration might indicate a failed attempt, while a long duration could signify a productive mine.

Interpreting Geological Data

Understanding basic geology is a significant asset when using Tengraph. Gold is not found everywhere. Its presence is tied to specific geological processes and rock formations.

1. **Gold-Bearing Formations:** Familiarize yourself with common gold-bearing geological formations in your region of interest. This could include:
 1. **Quartz Veins:** Gold is frequently trapped within hydrothermal quartz veins that have formed in faults and fractures.
 2. **Alluvial Deposits:** Weathered gold from primary sources (quartz veins) is often transported and concentrated by water in rivers, creeks, and terraces.
 3. **Banded Iron Formations (BIFs):** In some geological settings, gold can be associated with BIFs.
 4. **Intrusive Rocks:** Certain igneous intrusions can be associated with gold mineralization.
2. **Geochemistry and Geophysics:** Advanced users can explore Tengraph's geochemical anomaly maps or geophysical survey data. These layers can

highlight areas with elevated gold or indicator element concentrations, or anomalies in magnetic or radiometric signatures that might be associated with gold deposits.

Focusing on Abandoned Workings

The goal is to find *old* gold mines, which often means abandoned sites.

Tengraph can help pinpoint these:

1. **Expired and Forfeited Leases:** As mentioned, these are prime candidates. When a lease expires or is forfeited, it often means the miner(s) found no more economically viable gold or moved on to new prospects. The area may still contain unexploited sections or deeper veins.
2. **Historical Mine Symbols:** Some Tengraph systems include symbols indicating known mine shafts, adits, mullock heaps (mine tailings), or quarries. These are direct visual cues of past mining.
3. **Topographical Features Indicating Workings:** Look for unnatural-looking mounds, depressions, or cleared areas on topographical maps that could be indicative of historical mining activity, such as open cuts or large spoil heaps.

Beyond Tengraph: Complementary Research and On-the-Ground Reconnaissance

Tengraph Online is a powerful tool, but it is not the entire puzzle. To truly maximize your chances of finding old gold mines, you must integrate its digital information with other forms of research and, importantly, on-the-ground investigation.

1. Archival Research

Historical Societies and Museums: Local historical societies and regional museums are treasure troves of information. They may have old maps, photographs, mining journals, and personal accounts from local prospectors

and miners that predate or supplement Tengraph data.

Government Archives: National and state archives can hold old prospecting licenses, company reports, and coronial inquests related to mining accidents, which can offer location clues or details about the types of gold found.

University Libraries and Geological Survey Publications: Academic libraries often house older geological reports and theses that may contain detailed information about specific mining areas or geological prospects not fully digitized in Tengraph.

2. On-the-Ground Reconnaissance

Once you have identified promising areas using Tengraph and archival research, it's time to visit the field. This is where careful observation and adherence to regulations are paramount.

1. **Safety First:** Old mine sites can be incredibly dangerous. Abandoned shafts are often unstable and unmarked. Adits can collapse. Be aware of your surroundings, wear appropriate safety gear (sturdy boots, gloves, helmet), and inform someone of your whereabouts. Never enter an old mine shaft or adit.
2. **Look for Physical Evidence:** On the ground, you'll be searching for physical manifestations of past mining:
 1. **Mullock Heaps (Tailings):** Piles of excavated rock that were brought to the surface.
 2. **Old Trackways and Roads:** Evidence of access routes to the mine.
 3. **Remnants of Structures:** Old timber supports, rusting machinery, or foundations of buildings.
 4. **Disturbed Ground:** Areas that look unnaturally dug or excavated, especially along creek beds or hillsides.
 5. **Old Timbers and Supports:** Be cautious as these can be fragile and dangerous.
3. **Watercourses for Alluvial Gold:** If looking for alluvial gold, thoroughly examine creek beds, terraces, and gravel deposits. Look for signs of old

sluicing channels or panning areas.

4. **Rock Outcrops for Hard Rock Gold:** Inspect exposed rock faces and hillsides for quartz veins or other mineralized zones that might have been worked.

3. Legal and Ethical Considerations

Before embarking on any exploration, it is crucial to understand the legal framework. Mining rights are often complex and vary by jurisdiction. Ensure you have the necessary permits and approvals. Respect private property and never trespass. Always prioritize environmental protection and leave no trace.

Conclusion: A Digital Gateway to the Golden Past

Tengraph Online represents a paradigm shift in how we can access and interpret historical mining information. By mastering its interface, understanding its data layers, and employing strategic search techniques, aspiring prospectors and historical enthusiasts can effectively pinpoint the locations of old gold mines. It transforms abstract historical accounts into tangible geographical coordinates, offering a digital gateway to the rich and often untold stories of gold rushes past. However, it is the synergy between this powerful digital tool, meticulous archival research, and responsible on-the-ground reconnaissance that truly unlocks the potential for discovery and a deeper appreciation of our mining heritage.

So, whether your interest lies in historical exploration, geological study, or the tantalizing prospect of uncovering a forgotten legacy, Tengraph Online provides an unparalleled starting point. The gold may have been extracted decades or centuries ago, but the history, the geology, and the potential for discovery remain, waiting to be unearthed through the power of this digital archive.

Questions & Answers About old gold mines how to find them using tengraph online

No	Question	Answer
----	----------	--------

1	How can I use Tengraph Online to discover potential old gold mine locations?	Tengraph Online is a powerful tool for identifying prospective old gold mine sites. You can utilize its geological mapping features, historical mine records, and mineral deposit databases to pinpoint areas with historical gold production. Look for known gold-bearing rock types, geological structures conducive to mineralization, and areas previously worked by prospectors.
2	What specific data layers within Tengraph Online are most useful for finding old gold mines?	Key data layers to focus on include historical mine workings (showing past production), geological maps (identifying gold-associated rock formations like quartz veins and igneous intrusions), geochemical survey data (highlighting anomalous gold concentrations), and tenement/exploration license areas which often reflect historical prospecting activity.
3	Are there any filters or search functions in Tengraph Online specifically designed for historical mining?	While Tengraph Online doesn't have a direct 'old gold mine' filter, you can effectively achieve this by combining searches. Filter by 'mineral occurrences' and then cross-reference with 'historical mine locations' or 'past production data.' You can also search for specific geological formations known to host gold.
4	What are the limitations of using Tengraph Online for finding undocumented gold mines?	Tengraph Online primarily relies on recorded data. Undocumented or lost mines, especially small-scale or ancient workings, may not be present in the database. It's also important to remember that historical records can be incomplete or inaccurate. Tengraph is a starting point, not a definitive guide to every single gold deposit.
5	Besides finding locations, what other information can Tengraph Online provide about old gold mines?	Tengraph Online can offer details on the type of mineralization, past production estimates, the geological context of the mine, and potentially associated mineral occurrences. This information is invaluable for understanding the potential of a site and planning further investigations.

6	Once I've identified a potential old gold mine on Tengraph Online, what are the next steps for on-the-ground exploration?	After identifying a promising location on Tengraph Online, the next steps involve thorough desktop research (including old maps and historical accounts), followed by field reconnaissance. This might include visual inspection of the area for signs of old workings (adits, shafts, spoil heaps), geological mapping, and potentially surface sampling to confirm the presence of gold.
